Installation guide artificial grass

Step 1: Make sure the area drains correctly. If you do not follow the process below, but dig down 1 ° approx. 100mm and add type 1 mot (slightly larger runway) and flat whack with automatic whacker plate. Then build your Quickgrass plastic cover frame before lining with Quickgrass grass barrier. Step 2: Remove the lawn and dig at a depth of 50mm (2 inches), then weed kill the area. Unless you're thinking of increasing your garden/area level for Quickgrass, then apply the killer grass to the area. Step 3: Use our Quickgrass® board system (50mm x 25mm x 3m) with Quickgrass points as part of the edge system to create a border framed around the perimeter of the area you are planning to install Quickgrass artificial grass. The advantage of using our plastic edge system is that it can be curved and folded in the shape of the edge of the lawn, even bent in a complete circle to go trees or round objects that you do not want to remove in your garden. Step 4: Lay Quickgrass Weed Barrier as a coating on the subbase before adding 6m to stone granny powder or stone grit 6mm to powder. Geotextile has a strong tear resistance and is an ideal stabilizing membrane. This will not only prevent weeds, but also stabilize the sub base before artificial grass is laid. Step 5: Apply 50mm layer of 6mm powdered Granny Stone or Grit over the compacted grass barrier using an automated whacker plate (This can be taken from your local rental shop) and level flat so the top of thebelow base is level with the top of the cover frame. ideally, avoid daring sand as part of your sub-base as this washes away in the years with rain and cause dives in your new quickgrass lawn. as approximate guide: 1 ton of 6mm to powder granny stone or grit jumbo sack filling a depth of 50mm will cover 8 square meters. Step 6: Slide your new artificial lawn quickgrass over your base area and leave rolled out flat for ideally 24 hours. this will allow the time of pre-rolled grass to settle for any crease time to ocire and the pile to please after being rolled. the hottest and sunnier the fastest time this process will take. Once it is resolved carefully cut the grass border with a sharp stanley creatises knife - due to the molecular structure of the artificial grass material sometimes bends when rolled. creatures will fall. the grass is not classified as defective when delivered or installed with folds. the grass de-creates quite evident on a daily basis, especially in warmer weather conditions. Sometimes this may take a number of days. Step 7: Always make sure to check the direction of the pile of your artificial lawn. try to lay the lawn in the opposite direction to control the shadow from one corner to another. you can find how the way your new artificial lawn rests when it turns around. always check this before making those final closing edge cuts. for the best natural appearance of the grass try to lay the grass with the pile turned towardswhere you look more so a typical back garden has the pile turned towards the house. Our range of herbs are so realistic that you can lay through your garden from left to right or right to left and will still be great as a secondary option. We do not recommend laying grass with face fur away from you as this will not give the best realistic look. Step 8: Using an automated brooching machine, knead the grass with 13mm galvanized graffe at the top of the Quickgrass edge frame. Step 9: Once satisfied with the results, brush pile with a rigid broom. Some of our herbs recommend the dried silica sand of the oven to be added to the surface of the grass after laying. This is especially recommended where there is high fall and regular play activities. See individual herbs for manufacturer recommendations. If it is recommended dry baked sand, usually 5kg per square meter, simply disperse over the total surface then brush with a stiff broom. How to get into your fast grass Step 1: The most important thing to ensure when combining two or more pieces of artificial grass, is that the pile runs in the same direction. Step 2: Lay the two pieces of artificial grass next to each other with the pile turned up, and align the edges together. One side will have the stack protruding the edge of the grass, 'THE OUTER', the other side will not have protruding from the pile 'THE INNER'. Step 3: Fold the edge of both pieces of grass back on themselves about a 25cm/a footside so show the back of the grass and see the point lines running on the back of the grass on the black latex support. Carefully cut back 2 point lines down each edge and depending on which grass within our range you have installed will depend on the fact that you cut the closest to both point lines possible or as far away from the point lines. We can recommend on this when you order your grass the best technical process dependent on which of our herbs you have selected. We advise you to see what the 2 sections look like when they are gathered before any glue is applied to make sure that the union will be beautiful. Take the "INNER" section first followed by the "OUTER" section so that the grass pile in the "OUTER" section leans on the side of the "INNER" section. Brush with hand and union on our grass will be heavily disguised. Step 4: Lay the EnviroStik Joining Green Side Tape Down with White Side until you apply adhesive to, on the ground including the 2 grass edges are folded back and pin tape down in place using a pair of nails. Step 5: Apply an adhesive EnviroStik pearl along the tape in a zig-zag line, on the tape. About 1 tube of our eroded adhesive will be zig-zag cover of about 3 meters. This will then give an excellent raised cover for artificial grass to join. Step 6: Explain one side of the artificial grass 'THE INNER' on half of the joint tape, then fold the other side 'THEon the tape. Make sure your two pieces of artificial grass throw up together until the union seam. Step 7: Press firmly, brush with your hands and fingers along the length of the seam to ensure that the sticks stick properly and let dry. It is necessary to allow 24 hours for this to dry and cure properly. Don't use grass. play on it or brush it until this drying/drying process is past. Step 8: Once satisfied with the results, brush pile with a rigid broom. Video – Showing how to combine Quickgrass Step 1: your artificial grass can be easily installed on any concrete surface or hard and smooth, provided you drain space including previously covered areas. Step 2: Remove any debris from the area you want to cover. Step 3: Lay your artificial grass on the area. Step 4: Extend the artificial meadow to remove any ripples and fix around the perimeter using the EnviroStik Aqua-Bond Adhesive by placing each edge with a Stanley knife. Step 5: Once satisfied with the results, brush pile with a rigid broom.
